

Application for Web Thermometers:

Limit value alerts sent via TCP client

Product overview

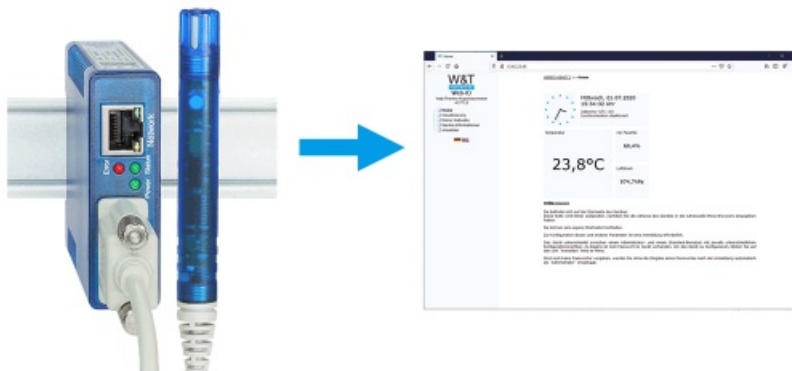

Application overview

Send limit value alarms and information messages via a TCP client and receive alarm messages from the sensor using your own TCP server applications - here you will learn how that works:

1. Configuration of your Web Thermometer

- Start up your unit by connecting the sensor, power supply and network cable and assigning an IP address using WuTility or DHCP. Then open the browser.

2. Configuration of a TCP message

- Configure a new message using the menu item "Alarms/Message" by first creating a trigger condition.

Auswahl:

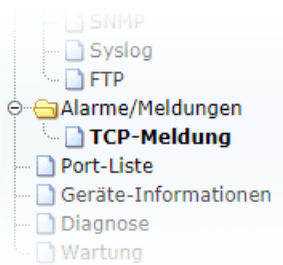

Temperatur

Minimum:

Maximum:

24

- In the "TCP Message" field enter a recipient address, a port number and a corresponding text. The function is now ready to use.

TCP-Server Adresse:

TCP Server Port:

TCP Text:

3. Operation

- When the specified limit is violated (over or under) the message is sent to your TCP server application via TCP client.

Do you not have a Web Thermometer but simply want to try this out using the example?

No problem: We will be happy to provide you with a unit for 30 days at no charge. Order the Web Thermometer as a sample and we will ship it to you for testing on open account. If you return the unit within 30 days, we will mark the invoice as fully paid.
