

Application for the Web-IO Digital:

Connecting Web-IO Digital to the network

Product overview 

Application overview 

Simple connection to a local network

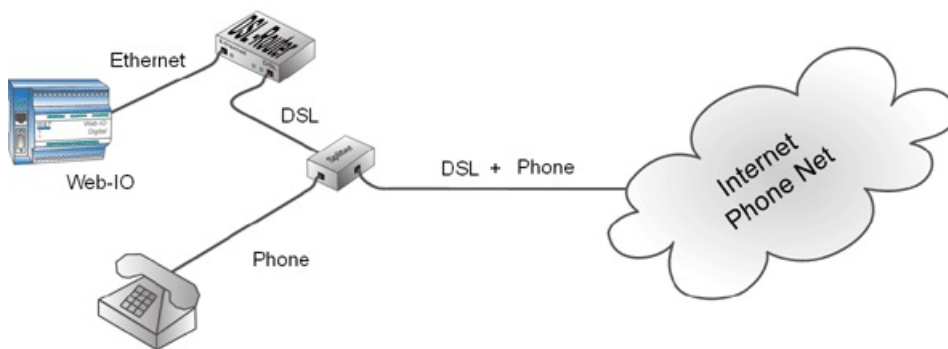

For connecting to an Ethernet LAN all that is needed is an available port on a switch or hub. All Web-IOs support both 100BaseT and 10BaseT, whereby the network speed is automatically detected.

Incorporating Web-IO into a wireless LAN

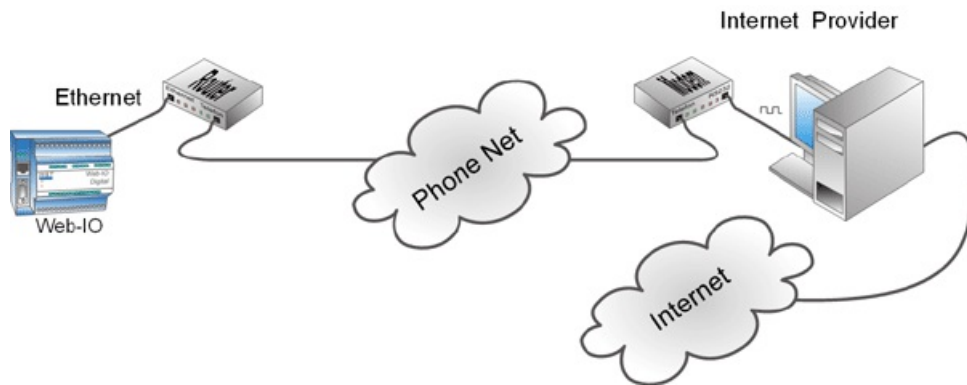

The W&T Web-IOs come shipped with a cable-connected Ethernet port for network access. A wireless LAN client bridge or a wireless access point can be used to easily incorporate Web-IOs into existing WLANs. This makes it easy to implement wireless remote control and monitoring. [Additional information about WLAN integration](#)

Connecting Web-IO to the Internet using DSL

More and more applications are operating cross-location. Since the majority of connected locations today use a DSL internet connection, it makes sense to use this method for applications in building and automation technology. [Detailed information](#)

Connecting Web-IO to the Internet using ISDN or the analog telephone network.

At locations where there is neither DSL nor any other kind of WAN connection available, Web-IOs can be connected over the land line or cellular network to the Internet or to other locations using appropriate routers.
