

Tutorial:

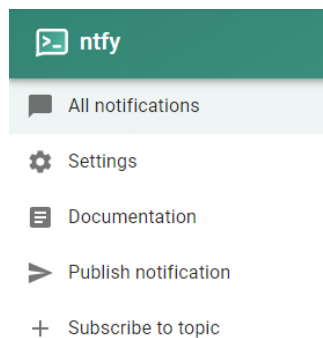

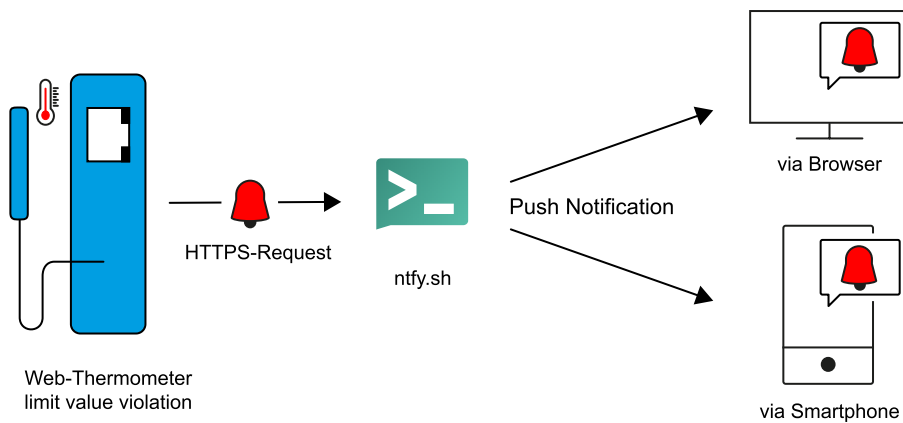

# Web Thermometer sends push notifications via ntfy.sh

## Manual: Report limit violations to a cell phone

ntfy.sh is a public messaging service. It is topic-oriented, i.e. notifications are sent by specifying unique topic names. To receive notifications, the relevant topic names must be subscribed.

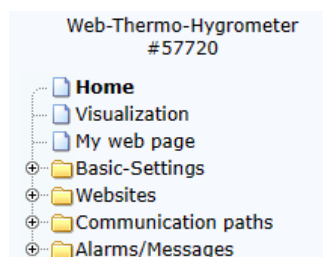

These are not closed groups, rather anyone knowing the name of the topic has access to the notifications sent there.

You can download the app from the usual providers (Google Play, App-Store), but there is also access from your web browser at [ntfy.sh](https://ntfy.sh).

Open the web app at [ntfy.sh](https://ntfy.sh) in your browser. Clicking on **+ Subscribe topic** opens a dialog in which you can enter the topic name you would like to subscribe to. This also creates the topic. Enter a unique name (e.g. WEBIO-123456). Pressing **SUBSCRIBE** subscribes you to notifications under this topic.

The procedure is identical in the mobile app with Android and Apple.

As soon as the topic you created is subscribed, configure sending of the notification in your Web Thermometer. Enter the IP address of the Web Thermometer in the browser and log in to the web interface with administrator rights. In the menu click on **Alarms/Messages** and there on **Add**.

An input screen appears for alarm configuration. First enable the new alarm and assign an appropriate name. As the trigger select **Temperature** and enter the permissible high and low limits.

## ntfy.sh test

Meldung konfigurieren

Einstellungen <span style="float: right;">▲</span>	
Meldung:	<input checked="" type="checkbox"/> aktiviert <span style="float: right;">i</span>
Meldung Name:	Meldung Name: <input type="text" value="ntfy.sh test"/> <span style="float: right;">i</span>
Auslöser:	Auswahl: <span style="float: right;">i</span> <input type="text" value="Temperatur"/> <span style="float: right;">v</span> Minimum: <input type="text" value="20"/> Maximum: <input type="text" value="24"/> Überwachungsbereich: <span style="float: right;">i</span> <input checked="" type="radio"/> Bereich außerhalb der Grenzwerte überwachen <input type="radio"/> Bereich innerhalb der Grenzwerte überwachen Hysterese: <span style="float: right;">i</span> <input type="text"/> Änderungsrate: <span style="float: right;">i</span> <input type="text"/>
Verzögerung:	Verzögerungszeit (Minuten): <input type="text" value="0"/> <span style="float: right;">i</span>
Wiederholung:	<input checked="" type="radio"/> Meldung einmalig senden <span style="float: right;">i</span> <input type="radio"/> Meldung zyklisch senden

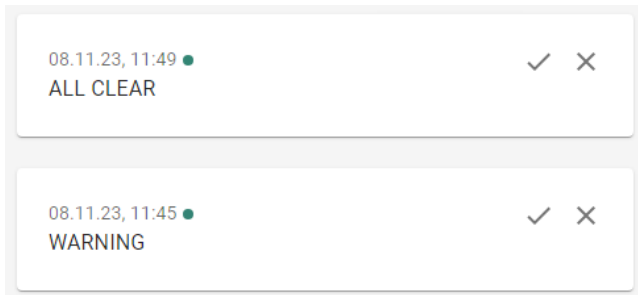

It is also possible to set [hysteresis](#), a [change rate](#), a [delay time](#) as well as [repeating](#) of the alarm (once or cyclical).

E-Mail Meldung:	<input type="checkbox"/> konfigurieren <span style="float: right;">i</span>
SNMP Trap/Notification:	<input type="checkbox"/> konfigurieren <span style="float: right;">i</span>
TCP Meldung:	<input type="checkbox"/> konfigurieren <span style="float: right;">i</span>
Syslog Meldung:	<input type="checkbox"/> konfigurieren <span style="float: right;">i</span>
FTP Meldung:	<input type="checkbox"/> konfigurieren <span style="float: right;">i</span>
MQTT Publish:	<input type="checkbox"/> konfigurieren <span style="float: right;">i</span>
HTTP Request:	<input checked="" type="checkbox"/> aktiviert <span style="float: right;">i</span> Authentifizierung verwenden: <input type="text" value="keine"/> <span style="float: right;">v</span> Request-Methode: <input type="text" value="POST"/> <span style="float: right;">v</span> HTTP(S)-Request (komplette URL): <input type="text" value="https://ntfy.sh/WEBIO-123456"/> Content Type: <span style="float: right;">i</span> <input type="text" value="text/plain"/> <span style="float: right;">v</span> Payload: <input type="text" value="ACHTUNG!"/> HTTP(S)-Request Clear-Meldung (komplette URL): <input type="text" value="https://ntfy.sh/WEBIO-123456"/> Clear Payload: <input type="text" value="ENTWARNUNG"/> HTTP(S)-Server-Port: <span style="float: right;">i</span> <input type="text" value="443"/>

Further below select [HTTP Request](#). Now the form expands and you are granted access to the associated parameters. You set the request method here at [POST](#). The field [HTTP\(S\) request \(complete URL\)](#) as well as [HTTPS\(S\) request clear message \(complete URL\)](#) contains the ntfy.sh URL for your topic. Everything behind [https://ntfy.sh/](#) represents the name of your topic. In the [Payload](#) field write the alarm message, and [Clear Payload](#) generates the caution message. Clicking on [Apply](#) confirms the alarm.

When the set temperature limits are violated or when the measured value returns to the tolerance range, a message is

issued:

Placeholders in the message text also allow you to insert dynamic variables such as the current measurement values. A **<T1>** in the message text is replaced in the output by the current temperature. This is a way to enlarge the information content of the sent messages. An exact list of the available placeholders can be found in the manual for the device.

## Product overview: Web Thermometer

The Web Thermometer is a device which acquires the temperatures and makes the values available in the network. It includes an integrated data logger and numerous web and network services for manually querying the measurements or for independent sending of the messages.

### Web Thermometer Pt100 / Pt1000

- Temperature sensor Pt100/Pt1000 with DB9 connection

### Web Thermometer NTC

- NTC temperature sensor with DB9 connection

### Web Thermometer 1xPt100 / Pt1000

- 1x Pt100/Pt1000 with wire terminal

### Web Thermometer 2x

- 2x Pt100/Pt1000 measuring input

### Web Thermometer 8x

- 8x Pt100/Pt1000 measurement input with screw terminals
